Integration Module Name
Microsoft Graph Security API

Microsoft Graph Security API Credentials

Application ID
Name

Tenant ID
Name

Client Secret
Name

Integration Module configuration

Entries Limit
Default

Defines the maximum number of endpoints

Quick Start

When configuring Microsoft Graph Security API integration, you must create an app in the [Azure Portal](#). After this is complete, you then add the Microsoft Graph Security API integration module in Secured.

1. Register an application with the Microsoft identity platform. For details, see [Register an application with the Microsoft identity platform endpoints](#).
2. In Secured, complete the [Add New Microsoft Graph Security API Integration Module](#) form.
 - **Integration Module Name** - Leave the default name or enter a name that is meaningful to you.
 - **Application ID**, **Tenant ID**, and **Client Secret** - Enter the account information from your Microsoft Graph Security API credentials.
 - **Entries Limit** - Specify the maximum number of endpoints in a single response, per requested observable (must be a positive value). We recommend that you enter a limit in the range of 50 to 1000. The default is 100 entries.
3. [Click Save](#) to complete the Microsoft Graph Security API integration module configuration.

Module: Microsoft Graph Security API	Confidence: None
Source: Microsoft Graph Security	Severity: Medium
Sensor: Endpoint	Environment: Global
	Resolution: N/A

DESCRIPTION
 Attackers can implant the right-to-left-override (RLO) in a filename to change the order of the characters in the filename and make it appear legitimate. This technique is used in different social engineering attacks to convince the user to run the file, and may also be used for hiding purposes. The file photoview[ps1] disguises itself as photoview1sp.jpg
