`ShortArray.asList(): List<Short>` Returns a [List] that wraps the original array.

`IntArray.asList(): List<Int>` Returns a [List] that wraps the original array.

`LongArray.asList(): List<Long>` Returns a [List] that wraps the original array.

`DoubleArray.asList(): List<Double>` Returns a [List] that wraps the original array.

`BooleanArray.asList(): List<Boolean>` Returns a [List] that wraps the original array.

`CharArray.asList(): List<Char>` Returns `true` if the two specified arrays are *deeply* equal to one another, i.e. contain the same number of the same elements in the same order. If two corresponding elements are nested arrays, they are also compared deeply. If any of arrays contains itself on any nesting level the behavior is undefined. The elements of other types are compared for equality with the `[equals][Any.equals]` function. For floating point numbers it means that `NaN` is equal to itself and `-0.0` is not equal to `0.0`.

`contentDeepEquals(other: Array<out T>): Boolean` Returns `true` if the two specified arrays are *deeply* equal to one another, i.e. contain the same number of the same elements in the same order. The specified arrays are also considered deeply equal if both are `null`. If two corresponding elements are nested arrays, they are also compared deeply. If any of arrays contains itself on any nesting level the behavior is undefined. The elements of other types are compared for equality with the `[equals][Any.equals]` function. For floating point numbers it means that `NaN` is equal to itself and `-0.0` is not equal to `0.0`.

`contentDeepHashCode(): Int` Returns a hash code based on the contents of this array as if it is [List]. Nested arrays are treated as lists too. If any of arrays contains itself on any nesting level the behavior is undefined.

`contentDeepToString(): String` Returns a string representation of the contents of this array as if it is a [List]. Nested arrays are treated as lists too. If any of arrays contains itself on any nesting level that reference is rendered as `"[...]"` to prevent recursion.

`contentDeepToString(): String` Returns `true` if the two specified arrays are *structurally* equal to one another, i.e. contain the same number of the same elements in the same order.
