## [Einführung](#)

Dieses Dokument enthält eine Beispielkonfiguration für die Implementierung eines ISDN-Backups mit freien statischen Routen und grundlegende Informationen zur Fehlerbehebung für diese Art von Konfiguration.

Informationen zu den häufigsten Implementierungen von ISDN-Backups und deren Vergleiche finden Sie im folgenden Dokument: [Evaluierung von Backup-Schnittstellen, Floating-statischen Routen und Dialer Watch für DDR-Backup](#).

## [Voraussetzungen](#)

### [Anforderungen](#)

Für dieses Dokument bestehen keine speziellen Anforderungen.

### [Verwendete Komponenten](#)

Die Informationen in diesem Dokument basieren auf den unten stehenden Software- und Hardwareversionen.

- Zwei Cisco 2500-Router mit Cisco IOS® Software-Versionen 12.2(3) und 12.2(5)

Die in diesem Dokument enthaltenen Informationen wurden aus Geräten in einer bestimmten

Laborumgebung erstellt. Alle in diesem Dokument verwendeten Geräte haben mit einer leeren (Standard-)Konfiguration begonnen. Wenn Sie in einem Live-Netzwerk arbeiten, stellen Sie sicher, dass Sie die potenziellen Auswirkungen eines Befehls verstehen, bevor Sie es verwenden.

## Konventionen

Weitere Informationen zu Dokumentkonventionen finden Sie in den [Cisco Technical Tips Conventions](#).

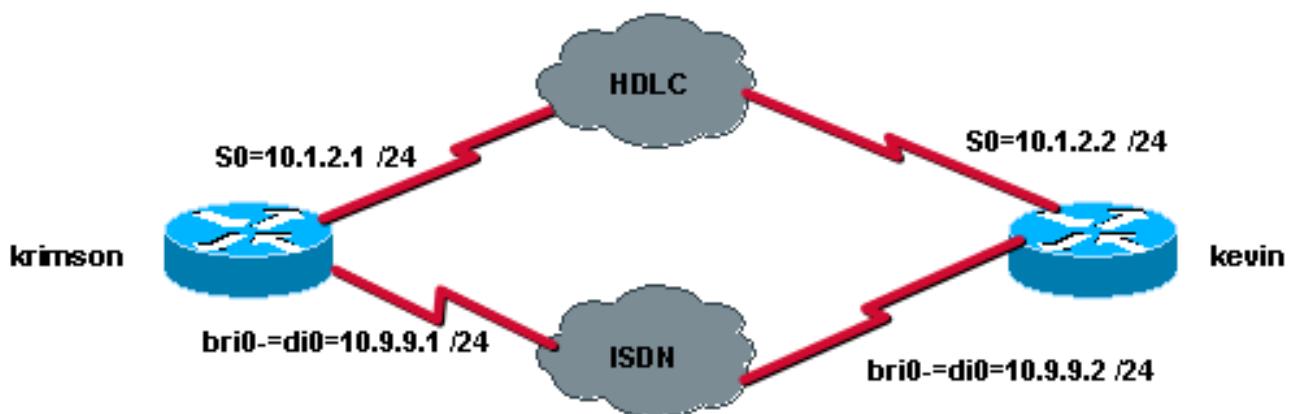

## Konfigurieren

In diesem Abschnitt erhalten Sie Informationen zum Konfigurieren der in diesem Dokument beschriebenen Funktionen.

**Hinweis:** Um weitere Informationen zu den in diesem Dokument verwendeten Befehlen zu erhalten, verwenden Sie das [Command Lookup Tool \(nur registrierte Kunden\)](#).

## Netzwerkdigramm

In diesem Dokument wird die im Diagramm unten dargestellte Netzwerkeinrichtung verwendet.

## Konfigurationen

In diesem Dokument werden die unten angegebenen Konfigurationen verwendet.

- [krimson \(Cisco Router der Serie 2500\)](#)
- [kevin \(Cisco Router der Serie 2500\)](#)

## Überprüfen

Dieser Abschnitt enthält Informationen, mit denen Sie überprüfen können, ob Ihre Konfiguration ordnungsgemäß funktioniert.

Bestimmte **show**-Befehle werden vom [Output Interpreter-Tool](#) unterstützt (nur [registrierte](#) Kunden),

mit dem Sie eine Analyse der **show**-Befehlsausgabe anzeigen können.

- **show ip route** - Zeigt Einträge der IP-Routing-Tabelle an.
- **show interfaces** - Zeigt Statistiken für alle auf dem Router oder Zugriffsserver konfigurierten Schnittstellen an.

## Fehlerbehebung

Dieser Abschnitt enthält Informationen zur Fehlerbehebung in Ihrer Konfiguration.

### Befehle zur Fehlerbehebung

Bestimmte **show**-Befehle werden vom [Output Interpreter-Tool](#) unterstützt (nur [registrierte](#) Kunden), mit dem Sie eine Analyse der **show**-Befehlsausgabe anzeigen können.

**Hinweis:** Bevor Sie **Debugbefehle** ausgeben, lesen Sie [Wichtige Informationen über Debug-Befehle](#).

- **debug isdn q931** - Zeigt Informationen zum Einrichten und Beenden von ISDN-Netzwerkverbindungen (Layer 3) zwischen dem lokalen Router (Benutzerseite) und dem Netzwerk an.
- **debug isdn events** - Zeigt ISDN-Ereignisse an, die auf Benutzerseite (auf dem Router) der ISDN-Schnittstelle auftreten. Bei den ISDN-Ereignissen, die angezeigt werden können, handelt es sich um Q.931-Ereignisse (Einrichten von Anrufen und Beenden von ISDN-Netzwerkverbindungen).
- **Debug Dialer** - Zeigt Debuginformationen zu Paketen oder Ereignissen auf einer Dialer-Schnittstelle an.
- **debug ppp negotiation** - Führt den Befehl **debug ppp** dazu, während des PPP-Starts übertragene PPP-Pakete anzuzeigen, über die PPP-Optionen ausgehandelt werden.
- **debug ppp authentication** - Führt dazu, dass der Befehl **debug ppp** Authentifizierungsprotokollmeldungen anzeigt, einschließlich CHAP-Paketaustausch (Challenge Authentication Protocol) und PAP-Austausch (Password Authentication Protocol).

### Beispielausgabe zur Fehlerbehebung

Hier können wir die Backup-Funktion testen, indem wir die Befehle **Shutdown** und **no Shutdown** auf der seriellen Schnittstelle auf der Remote-Seite verwenden. Dies führt infolgedessen zum Verschwinden der primären IP-Route zum betreffenden Zielnetzwerk.

Betrachten wir zunächst den Anfangsstatus der primären Schnittstelle und der IP-Routing-Tabelle:
