IPCOIR6LCWAITINFO	6-Information	CLC [dec]/[dec]> [chars]	The NPE OIR handler received a console error message from a distributed line card while in the crashwait state. The handler enters this state when it detects a Keepalive timeout on a distributed line card. During the crash wait period the LC is expected to collect and store crash information. At the end of the wait period the NPE will reload the LC. During this time it's possible that the LC will try to send error messages to it's console. Normally these would be sent to the NPE via the logger. However during the wait period the IPC link between the NPE and the LC is down so the OIR debug code provides a rudimentary method of collecting and displaying these messages	ubr7200-sw	"Report the problem to Cisco. LCINFO-3-INVDEV	3-Error	Invalid line card number in BPE callback LC=[dec]/[dec]	The line card crash information subsystem on the PRE was called from the BPE subsystem with an invalid slot/subslot. The slot or subslot number is out of range. This indicates a software defect in the system.	ubr10k-sw	"Report this defect with as much information about the BPE " subsystem as possible. There is no adverse effect to the PRE -- "it ignores the bad callback and continues. If the problem " persists reboot the router. It is unlikely but possible that " the problem is due to bad BPE hardware somewhere in the system."
LCINFO-3-INVSTATE	3-Error	Line card crash server in bad state LC=[dec]/[dec]state=[dec]	-	-	-
LCINFO-3-NOBUF	3-Error	Could not malloc line card crash structures on PRE size=[dec]	The PRE could not malloc data structures for line card crash data structures at startup time. This is not in and of itself a Serious problem but the underlying memory shortage at startup time will probably prevent the router from running well if at all.	ubr10k-sw	"Add more memory and/or debug the memory shortage problem."

LCNONLCHANGROC	3-Error	Failed creating line card hang cure process	When creating the LC hang cure process for checking prolonged CLC down states the create_process call failed. This should not happen. It is probably due to a software defect or hardware failure. This failure should only happen during initialization.	ubr10k-sw	"Rebooting the system should fix this. If the condition persists " "on subsequent reloads of the system a bug should be filed and " "the system should be reloaded with a different image."
LCINFO3NOPROCESS	3-Error	Failed creating line card complete process	When creating the crash complete process for the crash information subsystem the create_process call failed. This should not happen. It is probably due to a software defect or hardware failure. This failure should only happen during initialization.	ubr10k-sw	"Rebooting the system should fix this. If the condition persists " "on subsequent reloads of the system a bug should be filed and " "the system should be reloaded with a different image."

Family-Severity-Mnemonic	Severity-Meaning	Message	Message-Explanation	Component	Remarks
LCINFO-3-TIMEOUT	3-Error	Timeout waiting for crash info from slot [dec]/[dec]	The crash information complete timer expired. When a line card crashes it sends information to the PRE for debugging and analysis. When the START OF CRASH message is received a timer is set for approx 10 seconds. The line card has 10 seconds to send all the crash information to the PRE. This is not a crash dump -- this is a small amount of information that usually includes context stack trace etc. It is less than 8K bytes of information. If an END OF CRASH information message is not received before the timer goes off the crash information record is closed contains partial information this message is	ubr10k-sw	"No action is required specifically because this message was " "displayed. Because the line card was crashing there might be " "other defects to report. If this message is seen without a line " "card crashing report this defect with the output of the usual " "commands including show tech-support on the PRE *AND* on the line " "card that didn't crash but was mentioned in this error " "message."

Family-Severity-Mnemonic	Severity-Meaning	Message	Message-Explanation	Component	Remarks
LCINFO-4-LCHUNG	4-Warning	Slot [[dec]/[dec]] down on last [dec] checks. HW RESET # [dec] ...	A line card can get hung in some IOS operation and is not able to recover or when rommon can get stuck while initiating tftp bootload. This is the time when an external monitoring process on RP checks for health of each line card. And if the line card is found stuck for more than 150 seconds a hardware reset is issued for that subslot. ANd while issuing a hard reset this error message is displayed onto the console.	ubr10k-sw	"Report this LC defect with as much information about the LC"
LCINFO-4-TRUNC	4-Warning	Crash record [dec]=[chars] truncated expected=[dec]actual=[dec]	A line card crashed an was sending crash information to the PRE. The PRE received a CRASH RECORD START message that indicated the data would be \expected\ bytes long. Before that many bytes were received the PRE received another CRASH RECORD START message indicating the start of another record. The current record is marked as truncated and the next record is received but the anomoly is noted in this error message. This is a problem but because what started this process was a line card crashing this might only be a symptom of another underlying problem.	ubr10k-sw	"Report this defect with as much information about the BPE subsystem " "and the line card crash information subsystem possible."

Facility-Severity-Mnemonic	Severity-Meaning	Message	Message-Explanation	Component	Remarks
LCINFO-4-UNXMSG	4-Warning	Unexpected crash info msg type [chars] in state [chars] LC=[dec]/[dec]	The line card crash information subsystem received an unexpected message for the state it is in. The state and message type are given in the error message. This does not have any adverse effect on the PRE since it ignores and/or recovers from this occurrence. Because the sender of these messages is a line card that is crashing it is not completely unbelievable that this might happen. The source of the crash on the line card is more interesting. If this occurs without a line card crashing it is due to a stray/errant BPE message that should be persued. This could also be due to a dropped BPE message.	ubr10k-sw	"Find the source of the crash on the line card if one was crashing " "when the message occurred. If no line card was crashing report " "this defect with as much information about the BPE subsystem and " "the line card crash information subsystem as possible. If this " "message persists rebooting the router might help remove this " "message."
LCINFO-6-LCRESET	6-Information	PRE switchover. Reset empty slot [[dec]/[dec]]	When the standby PRE becomes active it resets all the slots which it thinks is empty. This prevents any linecards which was coming up during the PRE switchover from getting stuck	ubr10k-sw	""

The transient event queue used by LISP to store received RIB route import events reached the limit specified through the <code><CmdBold>{ipv4 ipv6} route-import maximum-prefix <limit><noCmdBold></code> configuration. Subsequent RIB events were dropped. There may now be an inconsistency between the routes present in the RIB and those imported by LISP. A re-evaluation of LISP route import for the affected EID table has been scheduled to attempt to automatically recover from this condition.	-	"Modify the LISP <CmdBold> " "configuration for the specified EID table to " "apply a route-map that only allows the desired RIB " "routes. If more routes are desired than the " "current limit you can increase it through the " <CmdBold> command. If " "error was a transient condition in the RIB you can " "force a re-evaluation of route import through the " <CmdBold> {ip ipv6} lisp route-import" <noCmdBold> "

DDT DDT_BAD_XIR_NONCE	6-Information	DDT resolver received two Map-Requests from [chars] for different EID prefixes but with the same nonce.	An xTR issuing LISP Map-Requests includes a nonce value in each request. The xTR must use a different nonce value for each Map-Request for a new EID prefix. The identified xTR has sent us two Map-Requests each for a different EID prefix and they both carried the same nonce value. When querying the DDT hierarchy duplicate nonce values prevent the DDT resolver from associating received Map-Referral messages with the correct request. MSM-VLAN-SUCCESS	6-Information	Unable to locate secondary-vlan for [inet][inet][dec]	This message happens when RP was not able to determine the secondary vlan for the source in secondary vlan. After finite retries RP gives up installing the shortcut in hardware. This can happen when a new flow is installed or when there is a RPF change. In such situations flow will be software switched.	cat6000-mmls	"Make sure ARP table is populated for sources in secondary vlan by explicitly 'ping'ing the source and the ARP table should contain the primary as well as secondary vlan information. To enable creation of hardware shortcut do a 'clear ip mroute <group> <source>' for the specific flow."

MLSM-6-SCP_ERROR	6-Information	MMLS: SCP failure detected between RP and SP	This can happen when EOBC channel is too busy or NMP is too busy so that draco side does not get response even after few retries by ICC layer.	cat6000	"Under some stressful condition when communication between RP and SP side can not be maintained this message will be printed. MMLS will keep trying to recover from situation by sending message to SP. The restart message to SP has exponential back off upto 160 second"
MSM-6-INSTALL_FAILURE	6-Information	interface/mask entry installation failed on [inet]/[dec] vlan[dec]	This message happens when Interface/mask entry to punt directly connected sources to the router could not be installed in HW-CEF table. This happens system is running out of available CEF entries. In this situation there might be blackholing of traffic for the directly connected sources on this interface	cat6000-mmls	"Modify the network config such that hardware resource limitation is not hit and ensure that interface/mask entry is installed."

Facility-Severity-Mnemonic	Severity-Meaning	Message	Message-Explanation	Component	Remarks
			<p>The ACL specified in the message text associates the key chain specified in the message text with a set of RSVP neighbors. RSVP uses the specified key chain to authenticate each RSVP message exchanged with that set of RSVP neighbors after the association is configured. Subsequently the specified ACL has been reconfigured such that the key chain association is no longer valid for one or more RSVP neighbors in the set. This causes RSVP to search the configuration for another suitable key chain to use with those neighbors. If no such key chain is found RSVP will no longer be able to provide authentication for messages exchanged with those RSVP neighbors. This causes RSVP to discard RSVP messages from that set of neighbors. Because this may ultimately lead to loss of RSVP functionality with those neighbors RSVP generates this system message. This system message may also be generated if the ACL is subsequently changed so that it re-associates RSVP neighbors with the specified key chain. If RSVP is not using another key chain for the set of RSVP neighbors specified by the ACL RSVP will begin using the</p>

SBC_HA_LARGE_SYNC_UNSUPPORTED	3-Error	The current version of the SBC Standby does not support the syncing of large SBC contexts	The current version of the SBC Standby does not support the syncing of large SBC contexts. A context that contains 24 or more media and signaling flows is a large context. It is rare to have such a large context and thus ISSU compatibility has been permitted even though this difference in support exists. Normal SBC High Availability synchronization will continue to operate successfully as long as no contexts contain more than 24 signaling or media flows.
