Pregunta

Cómo determinar la tasa de falla actual de una alarma en cualquier momento después del disparador inicial. La tasa inicial de fallos puede resultar más evidente, pero, ¿se encontraría posiblemente la tasa actual de fallos horas después?

Respuesta

Mientras que la trampa SNMP inicial, el registro y la alarma rastrean la tasa de falla inicial de un umbral monitoreado, puede que no sea obvio cómo obtener la tasa de falla actual. En la parte inferior de "show threshold", el comando informa del estado de todas las alarmas con respecto a la tasa de falla actual en el último intervalo de sondeo.

```
[local]PDSN> show threshold  
Friday June 12 04:39:32 UTC 2015
```

Outstanding alarms:

```
Threshold Name:      aaa-acct-failure-rate  
Alarm Source:        System  
Last Measured: 77% Raise Time: 2015-Jun-11+22:15:05
```

```
[local]PDSN> show thresh  
Friday June 12 05:34:04 UTC 2015
```

Outstanding alarms:

```
Threshold Name:      aaa-acct-failure-rate  
Alarm Source: System Last Measured: 65%  
Raise Time:          2015-Jun-11+22:15:05
```

```
[local]PDSN> show thresh  
Friday June 12 06:06:07 UTC 2015
```

Outstanding alarms:

```
Threshold Name:      aaa-acct-failure-rate  
Alarm Source:        System  
Last Measured: 61%  
Raise Time:          2015-Jun-11+22:15:05
```

```
[local]PDSN> show alarm outstanding verbose
Friday June 12 04:41:28 UTC 2015
