[Introduction](#)

Ce document illustre l'utilisation des commandes améliorées d'auto-inscription de certificat. Cette fonction est une amélioration qui vise à faciliter la gestion des certificats sur les routeurs. La fonction d'auto-inscription de certificat introduit cinq nouvelles commandes secondaires à la commande « `crypto ca trustpoint` ». Ces commandes sont « `ip-address` » (`ca-trustpoint`) (adresse ip), « `password` » (`ca-trustpoint`) (mot de passe), « `serial-number` » (numéro de série), « `subject-name` » (objet) et « `usage` ». Ces commandes ajoutent de nouvelles options pour les demandes de certificat et permettent aux utilisateurs de préciser des champs dans la configuration au lieu de devoir passer par des invites. Toutefois, l'invite demeure le comportement par défaut si cette fonction n'est pas activée. Les utilisateurs peuvent précharger toutes les informations nécessaires dans la configuration. Cela permet à chaque routeur d'obtenir son certificat automatiquement au démarrage.

Les autorités de certification des points de confiance combinent et remplacent les fonctionnalités des autorités de certification d'identité et de racine de confiance. Ainsi, la commande **`crypto ca trustpoint`** déprécie les commandes **`crypto ca identity`** et **`crypto ca trust-root`**. Les commandes **`auto-enroll regate`** et **`rsa-key label`** sont également abordées dans ce document.

Référez-vous à [Comment obtenir un certificat numérique d'une autorité de certification Microsoft Windows utilisant ASDM sur un ASA](#) afin d'en savoir plus sur le même scénario avec PIX/ASA 7.x.

Référez-vous à [Configuration du concentrateur Cisco VPN 3000 4.7.x pour obtenir un certificat numérique et un certificat SSL](#) afin d'en savoir plus sur le même scénario avec le concentrateur Cisco VPN 3000.

Conditions préalables

Conditions requises

Aucune spécification déterminée n'est requise pour ce document.

Components Used

Les informations de ce document s'appliquent à ces versions de logiciel et de matériel.

- Routeurs Cisco 7204, 2611 et 1720
- Serveurs de certificats autonomes Microsoft
- Logiciel Cisco IOS® versions 12.2(12.10)T et 12.2.11T

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, make sure that you understand the potential impact of any command.

Conventions

Pour plus d'informations sur les conventions utilisées dans ce document, reportez-vous à [Conventions relatives aux conseils techniques Cisco](#).

Informations générales

Outre les commandes Certificate Enrollment, les différentes commandes Certificate Enrollment Enhancement sont abordées :

- **crypto ca trustpoint** : déclare l'autorité de certification que le routeur doit utiliser.
- **subject-name [x.500-name]** : spécifie le nom du sujet dans la demande de certificat. Si la sous-commande **subject-name** n'est pas utilisée, par défaut, le nom de domaine complet (FQDN) du routeur est utilisé. Ceci est utilisé en mode de configuration ca-trustpoint. Par exemple, le format du nom x.500 est subject-name OU=ROME, O=ITALY.
- **adresse IP (adresse IP) | interface** : spécifie une adresse IP en pointillés ou une interface qui est incluse dans la demande de certificat. Ceci est utilisé en mode de configuration ca-trustpoint.
- **password string** : spécifie le mot de passe de révocation du certificat. Ceci est utilisé en mode de configuration ca-trustpoint. Puisque la liste de révocation de certificats (CRL) n'est pas utilisée dans ce document, tous les mots de passe sont définis sur « aucun ».
- **serial-number [none]** : spécifie si un numéro de série doit être inclus dans la demande de certificat. Ceci est utilisé en mode de configuration ca-trustpoint.
- **usage method1 [méthode2, [méthode3]]** : spécifie l'utilisation prévue pour le certificat. Les

options disponibles sont Internet Key Exchange (IKE), SSL-client et SSL-server. L'utilisation dans ce document est IKE. Ceci est utilisé en mode de configuration ca-trustpoint.

- **auto-enroll [régénération]** : demande automatiquement un certificat de routeur à l'autorité de certification qui utilise les paramètres de la configuration. Cette commande génère une nouvelle clé Rivest-Shamir-Adelman (RSA) uniquement si une nouvelle clé n'existe pas avec l'étiquette demandée. Utilisée en mode de configuration ca-trustpoint, cette commande vérifie les certificats de routeur expirés. Un point de confiance configuré pour l'inscription automatique tente de s'inscrire à nouveau lorsque le certificat du routeur expire. L'un des avantages de cette commande est que certaines autorités de certification ont besoin d'une nouvelle clé pour que la réinscription fonctionne. Par conséquent, la sous-commande est utilisée pour générer une nouvelle clé. L'inscription automatique est effectuée au démarrage pour toute autorité de certification de point de confiance configurée et ne possédant pas de certificat valide. Lorsque le certificat émis par une autorité de certification de point de confiance (configuré pour l'inscription automatique) expire, un nouveau certificat est demandé. Bien que cette fonctionnalité ne fournisse pas de renouvellement de certificat transparent, elle assure une récupération sans assistance à partir de l'expiration.
- **rsa-keypair key-label [key-size [encryption-key-size]]**—Spécifie la paire de clés à associer à un certificat. Cette commande est utilisée en mode de configuration ca-trustpoint. Dans de nombreux cas, un routeur peut être requis pour s'inscrire à plusieurs serveurs de certificats. Cependant, chaque serveur AC peut avoir une exigence de stratégie différente (par exemple, la longueur de clé). Cette sous-commande permet d'associer des paires de clés RSA de différentes tailles à des certificats d'identité de différents serveurs CA. Si la sous-commande n'est pas utilisée, le nom de domaine complet du routeur est utilisé par défaut. L'étiquette-clé est générée lors de l'inscription si elle n'existe pas déjà ou si la commande auto-enroll Regregate est exécutée. Spécifiez la taille de clé pour générer la clé et spécifiez la taille de clé de chiffrement pour demander un chiffrement, des clés de signature et des certificats séparés. Exemple :

```
2611-VPN(config)#crypto ca trustpoint caserver2
2611-VPN(ca-trustpoint)#rsa-keypair tacvpn 512 512
```

Remarque : Par défaut, la fonction d'inscription automatique demande un nouveau certificat lorsque l'ancien certificat expire. La connectivité peut être perdue lorsque la demande est traitée, car le certificat actuel et les paires de clés sont supprimés immédiatement après la génération de la nouvelle clé. La nouvelle clé n'a pas de certificat qui lui correspond tant que le processus n'est pas terminé, et les connexions IKE entrantes ne peuvent pas être établies tant que le nouveau certificat n'est pas émis. La fonction de renversement de clé pour le renouvellement de certificat introduite dans le logiciel Cisco IOS Version 12.3(7)T permet d'effectuer la demande de renouvellement de certificat avant l'expiration du certificat et de conserver l'ancienne clé et le certificat jusqu'à ce que le nouveau certificat soit disponible. Pour plus d'informations sur cette fonctionnalité, référez-vous à [Renvoi de clé pour le renouvellement de certificat](#).

[Configuration](#)

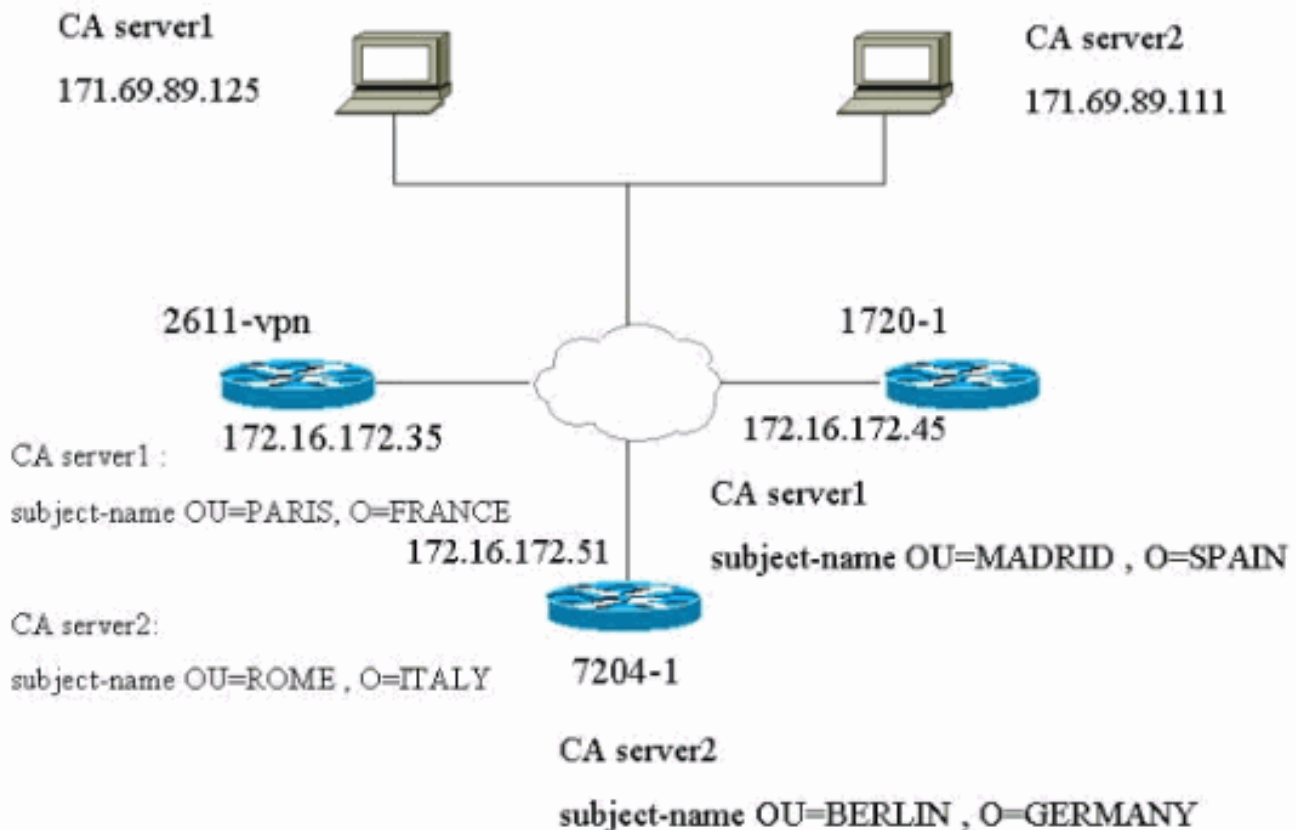

Cette section vous présente les informations pour configurer les fonctionnalités décrites dans ce document.

Remarque : Utilisez [l'outil de recherche de commandes](#) (clients [inscrits](#) seulement) pour en savoir

plus sur les commandes figurant dans le présent document.

Diagramme du réseau

Ce schéma de réseau présente les routeurs utilisés dans les travaux pratiques, les serveurs d'autorité de certification et le nom d'objet des certificats d'identité obtenus par le routeur à partir des deux serveurs d'autorité de certification.

Configurations

Ce document utilise les configurations suivantes. Le routeur 2611-VPN est le routeur concentrateur inscrit au serveur CA1 et au serveur CA2. Le routeur 2611-1 est inscrit auprès du serveur CA1 et le routeur 7204-1 est inscrit auprès du serveur CA2.

- [Configuration du routeur concentrateur VPN 2611 et certificats de deux serveurs CA différents](#)
- [Configuration et certificats du routeur 1720-1 à partir du serveur CA1](#)
- [Configuration et certificats du routeur 7204-1 de CA Server2](#)

Vérification

Ces sections indiquent si la configuration fonctionne ou non lorsque vous émettez ces commandes **show**. Ces commandes vérifient l'autorité de certification et si les certificats d'identité (certificats de routeur) ont été émis par le serveur d'autorité de certification.

L'[Outil Interpréteur de sortie \(clients enregistrés uniquement\) \(OIT\)](#) prend en charge certaines commandes **show**. Utilisez l'OIT pour afficher une analyse de la sortie de la commande **show**.

- **show crypto ca certificate** - Affiche des informations sur les certificats, le certificat de l'autorité de certification et tous les certificats de l'autorité d'enregistrement. Utilisez la commande **show crypto ca certificate** en mode EXEC.
- **crypto ca authenticate** : authentifie l'autorité de certification (récupère le certificat de l'autorité de certification). Utilisez la commande **crypto ca authenticate** en mode de configuration globale.
- **show crypto key mypubkey rsa** : affiche les clés publiques RSA du routeur. Utilisez la

- commande **show crypto key mypubkey rsa** en mode EXEC.
- **show crypto isakmp sa** - Affiche toutes les associations de sécurité (SA) Internet Key Exchange actuelles sur un homologue. Utilisez la commande **show crypto isakmp sa** en mode EXEC.
 - **show crypto ipsec sa** - Affiche les paramètres utilisés par les SA IPsec actuelles. Utilisez la commande **show crypto ipsec sa** en mode EXEC.
 - **show clock** : affiche l'heure système actuelle sur le routeur.
 - **agenda set hh:mm:ss day mois year** : définit l'heure du système de calendrier. Pour plus d'informations sur les différentes horloges et la définition de sources temporelles externes sur le routeur, référez-vous à [Exécution de la gestion de base du système](#).

Pour obtenir des commandes supplémentaires relatives à l'interopérabilité CA, à IPsec et à IKE, reportez-vous à [SR : Partie 4 : Commandes d'interopérabilité IP Security and Encryption and Certification Authority](#).

Cette sortie provient de la commande **show crypto ca certificate**.

Régénération des paires de clés RSA

Ces commandes sur le routeur 7204-1 illustrent l'utilisation de la commande **auto-enroll regate** et **rsakey label**. La figure montre la séquence d'événements après la déclaration de l'autorité de certification sur le routeur et après l'émission de la commande **crypto ca authenticate ca server**. La commande **auto-enroll** ne fonctionne qu'après l'authentification de l'autorité de certification. Une fois l'autorité de certification authentifiée, le routeur s'inscrit automatiquement auprès du serveur d'autorité de certification. Vous n'avez pas besoin d'émettre la commande **crypto ca enroll ca server**. Une fois le certificat d'identité expiré, le routeur s'inscrit automatiquement auprès du serveur AC. Avec l'introduction de cette commande, il n'est plus nécessaire de s'inscrire manuellement auprès du serveur AC une fois le certificat d'identité (routeur) expiré.

Vous n'avez pas besoin d'utiliser une source temporelle externe (serveur NTP) sur le routeur si vous définissez le système de calendrier sur le routeur avec la commande **Calendar set** afin de définir l'heure correcte. Le redémarrage du routeur synchronise l'horloge système avec le système de calendrier.

Remarque : La commande **Calendar set** n'est pas disponible sur les routeurs 1700 et 2600. Utilisez une source temporelle externe sur ces routeurs.

L'autorité de certification est configurée sur le routeur. Ce résultat détaille l'inscription automatique des certificats d'identité et la régénération de la paire de clés RSA sur le routeur 7204-1. Ce résultat est affiché en gras dans certains domaines pour souligner les informations importantes.

[Lorsque la paire de clés RSA n'existe pas](#)

Si la paire de clés RSA n'existe pas lors de l'inscription automatique, une paire de clés d'utilisation et d'usage général est générée automatiquement lors de l'inscription, comme le montre ce résultat. Cet exemple démarre sans configuration de certificat sur le routeur 7204-1 et aucune paire de clés RSA n'est générée.

[À l'expiration du certificat d'identité](#)

Le 2611-VPN n'a pas de source temporelle externe configurée et l'horloge système est utilisée pour suivre l'heure. Le serveur AC2 est déclaré sur le routeur, le serveur AC est authentifié et le

routeur 2611-VPN s'inscrit automatiquement auprès du serveur AC pour ses certificats d'identité. Le serveur AC est configuré pour émettre des certificats d'identité qui ne sont valides que pour une journée. Une fois le certificat expiré, le routeur s'inscrit automatiquement avec le serveur AC et la séquence des événements est affichée dans ce résultat.

Dépannage

Cette section fournit des informations que vous pouvez utiliser pour dépanner votre configuration.

Dépannage des commandes

Certaines commandes **show** sont prises en charge par l'[Output Interpreter Tool](#) (clients enregistrés uniquement), qui vous permet de voir une analyse de la sortie de la commande show.

Remarque : Avant d'émettre des commandes **debug**, reportez-vous à [Informations importantes sur les commandes de débogage](#).

- debug crypto pki transaction
- debug crypto pki messages
- debug crypto ipsec
- debug crypto isakmp

Débogues sur les routeurs

Les débogages IKE et IPSec des trois routeurs sont présentés dans ce résultat. Au cours des négociations IKE avec un homologue IPSec, le routeur 2600 doit décider quel serveur CA utiliser. Dans le scénario de test, les modèles 1720-1 et 7204 ont initié le tunnel IPSec vers le routeur VPN 2600.

Ce résultat montre les débogages IKE/IPSec sur le routeur 2611-VPN avec les commandes **show crypto**.

2611-VPN#show debug

Cryptographic Subsystem:

Crypto ISAKMP debugging is on

Crypto IPSEC debugging is on
