Túnel de site a site entre roteadores IOS usando a configuração de exemplo SEAL

Contents

Introduction

O algoritmo de criptografia de software (SEAL) é um algoritmo alternativo à criptografia padrão de dados (DES), ao DES triplo (3DES) e ao padrão de criptografia avançada (AES). A criptografia SEAL usa uma chave de criptografia de 160 bits e tem um impacto menor na CPU em comparação com outros algoritmos baseados em software. Este documento ilustra como configurar um túnel IPSec de LAN para LAN (de site para site) usando SEAL.

Prerequisites

Requirements

Não existem requisitos específicos para este documento.

Componentes Utilizados

As informações neste documento são baseadas nestas versões de software e hardware:

- Roteadores Cisco série 7200 executando o software Cisco IOS® versão 12.3(7)T

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, make sure that you understand the potential impact of any command.

Conventions

Para obter mais informações sobre convenções de documento, consulte as Convenções de dicas técnicas Cisco.

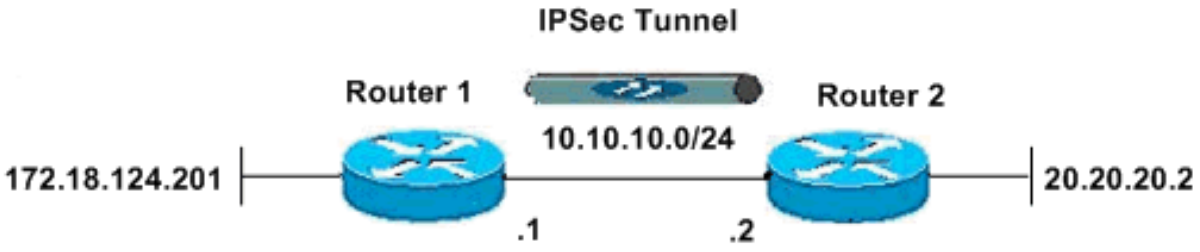
Configurar

Nesta seção, você encontrará informações para configurar os recursos descritos neste documento.

Nota:Use a Command Lookup Tool (somente clientes registrados) para obter mais informações sobre os comandos usados neste documento.

Diagrama de Rede

Este documento utiliza a seguinte configuração de rede:



Configurações

Este documento utiliza as seguintes configurações:

- Roteador 1
- Roteador 2

Roteador 1

```
version 12.3

Verificar

Esta seção fornece informações que você pode usar para confirmar se sua configuração está funcionando adequadamente.

A Output Interpreter Tool (somente clientes registrados) oferece suporte a determinados comandos show, o que permite exibir uma análise da saída do comando show.

- **show crypto map** —Verifica a configuração no roteador.Essa saída é tirada do Roteador 1.

```
R1#show crypto map
Crypto Map "cisco" 10 ipsec-isakmp
Peer = 10.10.10.2
Extended IP access list 100
access-list 100 permit ip 172.18.124.0 0.0.0.255 20.20.20.0 0.0.0.255
Current peer: 10.10.10.2
Security association lifetime: 4608000 kilobytes/3600 seconds
PFS (Y/N): N
Transform sets={
cisco,
}
Interfaces using crypto map cisco:
Ethernet1/0
```

Troubleshoot

Esta seção fornece informações que podem ser usadas para o troubleshooting da sua configuração.

Comandos para Troubleshooting

A Output Interpreter Tool (somente clientes registrados) oferece suporte a determinados comandos show, o que permite exibir uma análise da saída do comando show.

Observação: antes de inserir o comando **debug**, consulte Informações importantes sobre os comandos debug.

Depurações de ISAMP e IPSec

- **show debugging** —Exibe informações sobre os tipos de depuração que estão ativados para o roteador.

```
R1#show debugging
Cryptographic Subsystem:
Crypto ISAKMP debugging is on
Crypto IPSEC debugging is on

Limitações com o conjunto de transformação do selo de esp

Há três limitações no uso do conjunto de transformação **esp-selo**:

- O conjunto de transformação **do selo esp** só pode ser usado se não houver aceleradores de criptografia. Essa limitação está presente porque nenhum acelerador de criptografia atual implementa o conjunto de transformação de criptografia SEAL e, se um acelerador de criptografia estiver presente, ele lidará com todas as conexões IPSec negociadas com IKE. Se um acelerador de criptografia estiver presente, o software Cisco IOS permitirá que o conjunto de transformações seja configurado, mas avisará que ele não será usado enquanto o acelerador de criptografia estiver ativado.
- O conjunto de transformação **esp-selo** só pode ser usado em conjunto com um conjunto de transformação de autenticação, ou seja, um destes: **esp-md5-hmac, esp-sha-hmac, ah-md5-hmac** ou **ah-sha-hmac**. Essa limitação está presente porque a criptografia SEAL é especialmente fraca quando se trata de proteger contra modificações do pacote criptografado. Portanto, para evitar essa fraqueza, é necessário um conjunto de transformação de autenticação (os conjuntos de transformação de autenticação são projetados para impedir esses ataques.) Se você tentar configurar um conjunto de transformação de IPSec usando SEAL sem um conjunto de transformação de autenticação, um erro será gerado e o conjunto de transformação será rejeitado.
- O conjunto de transformação **esp-selo** não pode ser usado com um mapa de criptografia de chaveamento manual. Essa limitação está presente porque tal configuração reutilizaria o mesmo fluxo de chaves para cada reinicialização, o que comprometeria a segurança. Devido ao problema de segurança, tal configuração é proibida. Se você tentar configurar um mapa de criptografia de chaveamento manual com um conjunto de transformação baseado em SEAL, um erro será gerado e o conjunto de transformações será rejeitado.
