Introduction Prerequisites Requirements Componentes Utilizados Configurar Diagrama de Rede Obter certificado VCS Gerar e carregar certificado autoassinado VCS Adicionar certificado autoassinado do servidor CUCM para o servidor VCS Carregar certificado do servidor VCS para o servidor CUCM Conexão SIP Verificar Troubleshoot Informações Relacionadas

Introduction

Este documento descreve como configurar uma conexão segura do Session Initiation Protocol (SIP) entre o Cisco Unified Communications Manager (CUCM) e o Cisco TelePresence Video Communication Server (VCS).

O CUCM e o VCS estão intimamente integrados. Como os endpoints de vídeo podem ser registrados no CUCM ou no VCS, os troncos SIP devem existir entre os dispositivos.

Prerequisites

Requirements

A Cisco recomenda que você tenha conhecimento destes tópicos:

- Cisco Unified Communications Manager
- Servidor de comunicação por vídeo Cisco TelePresence
- Certificados

Componentes Utilizados

Este documento não se restringe a versões de software e hardware específicas. Este exemplo usa o software Cisco VCS versão X7.2.2 e CUCM versão 9.x.

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, make sure that you understand the potential impact of any command.

Configurar

Verifique se os certificados são válidos, adicione os certificados aos servidores CUCM e VCS para que eles confiem nos certificados uns dos outros e estabeleça o tronco SIP.

Diagrama de Rede

Obter certificado VCS

Por padrão, todos os sistemas VCS vêm com certificado temporário. Na página admin, navegue para **Manutenção > Gerenciamento de certificado > Certificado do servidor**. Clique em **Mostrar certificado do servidor** e uma nova janela será aberta com os dados brutos do certificado:

Server certificate				
Note: This VCS is part of a cluster but is not the configuration master. Any configuration changes made on this VCS may be lost. More information can be found on the Clustering help page.				
Server certificate data				
Server certificate	PEM File Show server certificate			
Currently loaded certificate expires on	Sep 30 2014			
Reset to default server certificate				
Reset to default server certificate				

Este é um exemplo dos dados brutos do certificado:

FND CERTIFICATE

Você pode decodificar o certificado e ver os dados do certificado usando o OpenSSL em seu computador local ou usando um decodificador de certificado online, como o <u>SSL Shopper</u>:

Gerar e carregar certificado autoassinado VCS

Como cada servidor VCS tem um certificado com o mesmo nome comum, você precisa colocar novos certificados no servidor. Você pode optar por usar certificados autoassinados ou certificados assinados pela Autoridade de Certificação (CA). Consulte o <u>Cisco TelePresence</u> <u>Certificate Creation and Use With Cisco VCS Deployment Guide</u> para obter detalhes deste procedimento.

Este procedimento descreve como usar o próprio VCS para gerar um certificado autoassinado e depois carregar esse certificado:

1. Faça login como raiz no VCS, inicie o OpenSSL e gere uma chave privada:

2. Use esta chave privada para gerar uma CSR (solicitação de assinatura de certificado):

OpenSSL> req -new -key privatekey.pem -out certcsr.pem You are about to be asked to enter information that will be incorporated into your certificate request. What you are about to enter is what is called a Distinguished Name or a DN. There are quite a few fields but you can leave some blank For some fields there will be a default value, If you enter '.', the field will be left blank. _ _ _ _ _ Country Name (2 letter code) [AU]:BE State or Province Name (full name) [Some-State]:Vlaams-Brabant Locality Name (eg, city) []:Diegem Organization Name (eg, company) [Internet Widgits Pty Ltd]:Cisco Organizational Unit Name (eg, section) []:TAC Common Name (e.g. server FQDN or YOUR name) []:radius.anatomy.com Email Address []: Please enter the following 'extra' attributes to be sent with your certificate request A challenge password []: An optional company name []: OpenSSL> exit

3. Gerar o certificado autoassinado:

```
~ # openssl x509 -req -days 360 -in certcsr.pem -signkey privatekey.pem -out vcscert.pem
Signature ok
subject=/C=BE/ST=Vlaams-Brabant/L=Diegem/O=Cisco/OU=TAC/CN=radius.anatomy.com
Getting Private key
~ #
```

4. Confirme se os certificados estão disponíveis:

~ # ls -ltr *.pem -rw-r--r- 1 root root 891 Nov 1 09:23 privatekey.pem -rw-r--r- 1 root root 664 Nov 1 09:26 certcsr.pem -rw-r--r- 1 root root 879 Nov 1 09:40 vcscert.pem

5. Baixe os certificados com <u>WinSCP</u> e carregue-os na página da Web para que o VCS possa usar os certificados; você precisa da chave privada e do certificado gerado:

Server certificate				
EXENCE: This VCS is part of a cluster but is not the configuration master. Any configuration changes made on this VCS may be lost. More information can be found on the Clustering help page.				
Server certificate data				
Server certificate	PEM File Show server certificate			
Currently loaded certificate expires on	Sep 30 2014			
Reset to default server certificate				
Certificate signing request (CSR)				
Certificate request	There is no certificate signing request in progress			
Generate CSR				
Upload new certificate				
Select the server private key file	"C:lprivatekey.pem"			
Select the server certificate file	"C:wcscert.pem" (j)			
Upload server certificate data				

6. Repita esse procedimento para todos os servidores VCS.

Adicionar certificado autoassinado do servidor CUCM para o servidor VCS

Adicione os certificados dos servidores CUCM para que o VCS confie neles. Neste exemplo, você está usando os certificados padrão autoassinados do CUCM; O CUCM gera certificados autoassinados durante a instalação para que você não precise criá-los como fez no VCS.

Este procedimento descreve como adicionar um certificado autoassinado do servidor CUCM ao servidor VCS:

 Baixe o certificado CallManager.pem do CUCM. Efetue login na página OS Administration, navegue para Security > Certificate Management e, em seguida, selecione e baixe o certificado autoassinado CallManager.pem:

END CERTIFICATE

Se você tiver vários servidores no cluster CUCM, adicione todos eles aqui.

4. Salve o arquivo como CATrust.pem e clique em **Upload CA certificate** para carregar o arquivo de volta ao VCS:

Trusted CA certificate				
Note: This VCS is part of a cluster but is not the configuration master. Any configuration changes made on this VCS may be lost. More information can be found on the <u>Clustering help page</u> .				
Upload				
Select the file containing trusted CA certificates	"C:\CATrust.pem" (Choose)			
CA certificate	PEM File Show CA certificate			
Upload CA certificate Reset to default CA certificate				

O VCS agora confiará nos certificados oferecidos pelo CUCM.

5. Repita esse procedimento para todos os servidores VCS.

Carregar certificado do servidor VCS para o servidor CUCM

O CUCM precisa confiar nos certificados oferecidos pelo VCS.

Este procedimento descreve como carregar o certificado VCS gerado no CUCM como um certificado CallManager-Trust:

1. Na página OS Administration, navegue até **Security > Certificate Management**, digite o nome do certificado, navegue até o local e clique em **Upload File**:

Upload Certificate/Certificate chain
Upload File Close
⊂ Status
i Status: Ready
Upload Certificate/Certificate chain
Certificate CallManager-trust
Description
Upload File "C:\vcscert.pem" Choose
- Upload File Close
indicates required item.

2. Carregue o certificado de todos os servidores VCS. Faça isso em cada servidor CUCM que se comunicará com o VCS; geralmente, são todos os nós que estão executando o serviço CallManager.

Conexão SIP

Depois que os certificados forem validados e ambos os sistemas confiarem um no outro, configure a Zona Vizinha no VCS e o Tronco SIP no CUCM. Consulte o <u>Guia de implantação do Cisco TelePresence Cisco Unified Communications Manager com Cisco VCS (tronco SIP)</u> para obter detalhes desse procedimento.

Verificar

Confirme se a conexão SIP está ativa na zona vizinha no VCS:

Edit zone Accept proxied registrations Media encryption mode		Deny - i		
Authentication Authentication policy SP authentication trust mode		Treat as authenticated •		
Location				
Peer 1 address		10.48.36.203		SIP: Active: 10.48.36.203:5061
