## [Introduction](#)

Este documento explica as configurações necessárias para a implementação do canal T1 associado à sinalização (CAS).

## [Prerequisites](#)

## [Requirements](#)

Certifique-se de atender a estes requisitos antes de tentar esta configuração:

Este documento é baseado na [compreensão de como o CAS T1 digital \(Robbed Bit Signaling\) funciona nos gateways do IOS](#). Leia este documento para entender os vários tipos de métodos de sinalização CAS. Este documento também serve como um guia para configurar os diferentes tipos de sinalização CAS.

Antes de implementar a sinalização E1 R2 em um roteador Cisco AS5300, verifique se sua versão do Cisco IOS® Software é compatível com o Cisco VCWare no módulo E1. Se as versões não forem compatíveis, os módulos do DSP (processador de sinal digital) na placa de voz não serão carregados e o processamento do sinal de voz não ocorrerá. Consulte a Matriz de compatibilidade do Cisco VCWare para o Cisco AS5300 para certificar-se que suas versões sejam compatíveis.

Normalmente, se a versão do Cisco VCWare não for compatível com o Cisco IOS Software, você pode ver isso inserindo o comando **show vfc slot\_number interface** como mostrado aqui:

```
5300#show vfc 1 interface
Rx: in ptr 18, outptr 0
Tx: in ptr 14 outptr 14
0 in hw queue, 0 queue head , 0 queue tail
Hardware is VFC out-of-band channel
Interface : state RESET DSP instance (0x61048284)
dsp_number 0, Channel ID 0
TX outstanding 0, max TX outstanding 0
Received 18 packets, 1087 bytes, 0 giant packets
0 drops, 0 no buffers, 0 input errors
121 bytes output, 14 frames output
0 bounce errors 0
```

```
DSP module 1 is not installed
DSP module 2 is not installed
DSP module 3 is not installed
DSP module 4 is not installed
DSP module 5 is not installed
```

Na saída acima, as instruções "DSP module number is not installed" mostram que as versões são incompatíveis para esse número de módulo. Um exemplo dos módulos DSP com a versão correta do Cisco VCWare é mostrado aqui:

```
5300#show vfc 1 interface
Rx: in ptr 24, outptr 0
TX: in ptr 15 outptr 15
0 in hw queue, 0 queue head , 0 queue tail
Hardware is VFC out-of-band channel
Interface : state RESET DSP instance (0x618C6088)
dsp_number 0, Channel ID 0
TX outstanding 0, max TX outstanding 0
Received 283288 packets, 15864278 bytes, 0 giant packets
0 drops, 0 no buffers, 0 input errors
1416459 bytes output, 141647 frames output
0 bounce errors 0
```

```
Slot 1, DSPM 1 (C542), DSP 1, Channel 1
State RESET, DSP instance (0x61914BDC)
TX outstanding 0, max TX outstanding 8
Received 0 packets, 0 bytes, 0 giant packets
0 drops, 0 no buffers, 0 input errors
0 bytes output, 0 frames output
0 bounce errors 0
```

```
Slot 1, DSPM 1 (C542), DSP 2, Channel 1
State RESET, DSP instance (0x6191510C)
TX outstanding 0, max TX outstanding 8
Received 0 packets, 0 bytes, 0 giant packets
0 drops, 0 no buffers, 0 input errors
0 bytes output, 0 frames output
0 bounce errors 0
```

Para verificar a versão instalada do Cisco VCWare, digite o comando **show vfc slot\_number version vcware** conforme mostrado aqui:

```
5300#show vfc 1 version vcware
Voice Feature Card in Slot 1:
VCware Version : 4.10
ROM Monitor Version : 1.2
DSPware Version :
```

**Observação:** verifique se a versão da tecnologia Cisco VCWare (c549 ou c542) corresponde à tecnologia DSP da placa de recurso de voz instalada (DSPM-542: suporte de voz de densidade única ou DSPM-549: suporte de voz de alta densidade).

## Componentes Utilizados

As informações neste documento são baseadas nestas versões de software e hardware:

- Roteador Cisco AS5300 (todas as versões)

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, make sure that you understand the potential impact of any command.

## Conventions

Consulte as [Convenções de Dicas Técnicas da Cisco para obter mais informações sobre convenções de documentos](#).

## Configurar

Nesta seção, você encontrará informações para configurar os recursos descritos neste documento.

Nota: Use a Command Lookup Tool (somente clientes registrados) para obter mais informações sobre os comandos usados neste documento.

## Configurações

Para executar a sinalização CAS nos Cisco 2600/3600 Series Routers, um NM-HDV (High Density Voice Network Module) é necessário.

O comando ds0-group (ou cas-group, dependendo da versão do Cisco IOS) precisa ser definido nos controladores T1 (Cisco AS5xxx e 2600/3600 routers).

Use este procedimento para configurar o CAS:

1. Configure o controlador T1 conectado ao PBX (private automatic branch exchange, troca de ramais automática) ou ao switch. Verifique se o enquadramento e a codificação de linha do T1 foram definidos corretamente. Enquadramento de T1: **ESF ou SF** Codificação de linha T1: **B8ZS ou AMI** Fonte de tempo T1: **interno ou linha** **Observação:** lembre-se de que diferentes PBXs têm requisitos diferentes na fonte do relógio.
2. Use esta sequência de comandos para definir a sinalização de linha nas plataformas AS5xxx:

```
5300(config)#controller T1 0
```

```
5300(config-controller)#
```

```
ds0-group 1 timeslots 1-24 type ?
```

```
e&m-fgb          E & M Type II FGB
```

```
e&m-fgd          E & M Type II FGD
```

```

e&m-immediate-start  E & M Immediate Start
fgd-eana             FGD Exchange Access North American
fgd-os              FGD Operator Services
fxs-ground-start    FXS Ground Start
fxs-loop-start      FXS Loop Start
none                Null Signaling for External Call Control
r1-itu              R1 ITU
sas-ground-start    SAS Ground Start
sas-loop-start      SAS Loop Start
<cr>

```

**Observação:** se quiser coletar informações do DNIS (Serviço de Identificação de Número Discado) em um controlador T1, você deve configurá-las manualmente no servidor de acesso. Para coletar DNIS DTMF (Dual Tone Multifrequency) para E&M-fgb em uma configuração de T1 do controlador, use o comando **ds0-group 0 timeslots 1-24 type e&m-fgb dtmf dnis**. Para coletar DNIS de multifreqüência (MF) DNIS para E&M-fgb, use o comando **ds0-group 0 timeslots 1-24 type e&m-fgb mf dnis**.

- Use esta seqüência de comandos para definir a sinalização de linha nas plataformas Cisco 2600/3600:

```

3600(config)#controller T1 0
3600(config-controller)#
ds0-group 1 timeslots 1-24 type ?

```

```

e&m-delay-dial      E & M Delay Dial
e&m-fgd  E & M Type II FGD
e&m-immediate-start E & M Immediate Start
e&m-wink-start      E & M Wink Start
ext-sig            External Signaling
fgd-eana          FGD-EANA BOC side
fxo-ground-start  FXO Ground Start
fxo-loop-start    FXO Loop Start
fxs-ground-start  FXS Ground Start
fxs-loop-start    FXS Loop Start
none              Null Signaling for External Call Control
<cr>

```

Com o Cisco IOS Software Release 11.3, a seqüência de comandos é a seguinte.

```

peggy(config)#controller T1 0

peggy(config-controller)#cas-group 1 timeslot 1-15 type ?

```

...

**Observação:** se você atualizar do Cisco IOS Software Release 11.3 para Release 12.0, o novo comando substituirá o antigo automaticamente.

Este documento utiliza as seguintes configurações:

- [Cisco 5300 configurado para E&M-FGD DTMF DNIS](#)
- [Cisco 5300 configurado para E&M-FGB](#)
- [Cisco 3600 configurado para E&M FGB \(início de piscar\)](#)

#### Cisco 5300 configurado para E&M-FGD DTMF DNIS

```

hostname 5300-fg-d
!
controller T1 0
clock source line primary

```

```
ds0-group 1 timeslots 1-24 type e&m-fgd dtmf dnis
```

```
!--- With this configuration we will use DTMF and !---  
request the DNIS information. ! voice-port 0:1 ! dial-  
peer voice 123 pots destination-pattern 123 direct-  
inward-dial !--- This will only work if the DNIS  
information is recieved. port 0:1 prefix 123 ! dial-peer  
voice 567 voip destination-pattern 567 session target  
ipv4:2.0.0.2 !
```

### Cisco 5300 configurado para E&M-FGB

```
hostname 5300-fg-b  
!  
controller T1 0  
  
clock source line primary  
  
ds0-group 1 timeslots 1-24 type e&m-fgb  
!  
voice-port 0:1  
!  
dial-peer voice 123 pots  
  
destination-pattern 123  
  
port 0:1  
  
prefix 123  
!  
dial-peer voice 567 voip  
  
destination-pattern 567  
  
session target ipv4:2.0.0.2  
!
```

### Cisco 3600 configurado para E&M FGB (início de piscar)

```
hostname 3600-fg-b  
!  
controller T1 1/0  
  
clock source line primary  
  
ds0-group 1 timeslots 1-24 type e&m-wink-start  
!  
voice-port 1/0:1  
!  
dial-peer voice 123 pots
```

```
destination-pattern 123

port 1/0:1

prefix 123

!

dial-peer voice 567 voip

destination-pattern 567

session target ipv4:2.0.0.2
```

## Verificar

No momento, não há procedimento de verificação disponível para esta configuração.

## Troubleshoot

Esta seção fornece informações que podem ser usadas para o troubleshooting da sua configuração.

### Procedimento de Troubleshooting

Siga estas instruções para resolver problemas da sua configuração. Consulte [Personalização de E1 R2 com o Comando cas-custom](#) para obter informações adicionais sobre solução de problemas.

1. Verifique se o controlador T1 0 está ativado. Se estiver fora do ar, verifique os quadros, a codificação das linhas, a fonte de tempo, os alarmes, substitua o cabo, reencaixe a placa de linha e assim por diante.
2. Se estiver usando um Cisco AS5300, verifique se os DSPs estão instalados corretamente com o comando **show vfc slot number interface**.
3. Com relação a troncos FGD, configure direct inward dial (DID) no peer de serviço de telefonia tradicional (POTS) de modo que os dígitos recebidos sejam usados para escolher um peer enviado. **Observação:** no Cisco AS5300 você precisará ter a opção "dnis" configurada para solicitar DNIS.
4. Ative alguns dos comandos de depuração mostrados na seção seguinte e analise as saídas
5. Check for communication between the router and PBX or Switch. A linha está capturada? O roteador recebe/envia dígitos? Descubra que lado está removendo a chamada. Se possível, use as versões mais recentes do Cisco IOS Software disponíveis no Cisco.com.

### **Determinação de Sinalização em um Roteador Cisco AS5xxx.**

Pode ser difícil determinar que tipo de sinalização você tem ao examinar as depurações de um roteador. No entanto, é possível adivinhar bem o que deve ser a sinalização. A depuração a seguir é relativamente confiável (principalmente quando todos os canais estão ociosos) na determinação do tipo de sinalização. Recomenda-se verificar primeiro a sinalização através das depurações de modo que possam captar os erros de provisão mais comuns e não tão óbvios. Como de costume, tenha cuidado ao ativar as depurações no roteador. Convém não habilitar a

depuração a não ser que você esteja familiarizado com as suas funcionalidades. Esteja ciente de que nem todas as depurações estão disponíveis para cada plataforma de servidor de acesso à rede (NAS).

## Comandos para Troubleshooting

A [Output Interpreter Tool \(somente clientes registrados\) \(OIT\)](#) oferece suporte a determinados [comandos show](#). Use a OIT para exibir uma análise da saída do comando show.

**Nota:** Consulte **Informações Importantes sobre Comandos de Depuração** antes de usar comandos debug.

- **debug serial interface** — Exibe informações sobre uma falha de conexão serial.
- **show controller t1** — Exibe o status do controlador específico para o hardware do controlador.
- **debug cas** — Para sinalização de linha em plataformas Cisco AS5xxx.
- **debug vpm signal** — Para sinalização de linha em plataformas Cisco 26xx/36xx.
- **debug vtsp all** — Ativa a saída de todas as mensagens (dígitos) trocadas entre o PBX e o roteador.

```
bosshog#debug serial interface
```

```
!--- This enables the output below. Serial network interface debugging is on bosshog#show controller t1
```

```
